

Process for the preparation of amino alcohols and derivatives thereof

The invention relates to a novel process for the preparation of (1R,4S)- or (1S,4R)-1-amino-4-(hydroxymethyl)-2-cyclopentene of the formulae

I

II

and/or of (1S,4R)- or (1R,4S)-amino alcohol derivatives of the general formulae

III

IV

and to novel microorganisms which are able to utilize a cyclopentene derivative of the general formula

VII

as sole nitrogen source, as sole carbon source or as sole carbon and nitrogen source.

The invention further relates to enzyme extracts and enzymes having N-acetylamino-alcohol hydrolase activity obtainable from these microorganisms.

(1R,4S)-1-Amino-4-(hydroxymethyl)-2-cyclopentene of the formula I is an important intermediate for the preparation of carbocyclic nucleosides such as, for example, Carbovir® (Campbell et al., J. Org. Chem. 1995, 60, 4602 - 4616).

Processes for the preparation of (1R,4S)-1-amino-4-(hydroxymethyl)-2-cyclopentene are described by Campbell et al. (ibid) and by Park K. H. & Rapoport H. (J. Org. Chem. 1994, 59, 394 - 399).

The precursor used in these processes is either D-glucono-δ-lactone or D-serine, and about 15 synthesis

stages are necessary to form (1R,4S)-N-tert-butoxycarbonyl-4-hydroxymethyl-2-cyclopentene, which is then deprotected to give (1R,4S)-1-amino-4-(hydroxymethyl)-2-cyclopentene. These two processes are costly, elaborate and cannot be implemented industrially.

WO 93/17020 describes a process for the preparation of (1R,4S)-1-amino-4-(hydroxymethyl)-2-cyclopentene, wherein (1R,4S)-4-amino-2-cyclopentene-1-carboxylic acid is reduced with lithium aluminium hydride to the desired product.

The disadvantage of this process is, on the one hand, that the double bond of the cyclopentene ring is also reduced, the lithium aluminium hydride is difficult to handle, and, on the other hand, that it is too costly.

Taylor, S. J. et al. (Tetrahedron: Asymmetry Vol. 4, No. 6, 1993, 1117 - 1128) describe a process for the preparation of (1R,4S)-1-amino-4-(hydroxymethyl)-2-cyclopentene starting from (+)-2-azabicyclo[2.2.1]hept-5-en-3-one as precursor. In this case, the precursor is converted by means of microorganisms of the species *Pseudomonas solanacearum* or *Pseudomonas fluorescens* into (1R,4S)-2-azabicyclo[2.2.1]hept-5-en-3-one, which is then converted with di-tert-butyl dicarbonate into (1R,4S)-N-tert-butoxycarbonyl-2-azabicyclo[2.2.1]hept-5-en-3-one, which is reduced with sodium borohydride and trifluoroacetic acid to the desired product. This process is much too costly.

In addition, Martinez et al. (J. Org. Chem. 1996, 61, 7963 - 7966) describe a 10-stage synthesis of (1R,4S)-1-amino-4-(hydroxymethyl)-2-cyclopentene starting from diethyl dialkylmalonate. This process also has the disadvantage that it is elaborate and cannot be implemented industrially.

It was an object of the present invention to provide a simple process for the preparation of (1R,4S)-1-amino-4-(hydroxymethyl)-2-cyclopentene.

This object is achieved with the microorganisms of the invention according to Claim 1, and enzyme extracts therefrom, with the enzymes of the invention

according to Claim 4 and with the process of the invention according to Claim 7.

The microorganisms of the invention can be isolated from soil samples, sludge or wastewater with the assistance of conventional microbiological techniques.

The microorganisms are isolated according to the invention by cultivating them in a nutrient medium containing one or more cyclopentene derivatives of the general formula

- 10 in which R<sup>1</sup> denotes C<sub>1</sub>-C<sub>4</sub>-alkyl, C<sub>1</sub>-C<sub>4</sub>-alkoxy, aryl or aryloxy,
- as sole carbon and nitrogen source
  - as sole nitrogen source with a suitable carbon source or
  - 15 • as sole carbon source with a suitable nitrogen source,
- in a conventional way.

It is possible to use as C<sub>1</sub>-C<sub>4</sub>-alkyl for example methyl, ethyl, propyl, isopropyl or butyl. It is possible to use as C<sub>1</sub>-C<sub>4</sub>-alkoxy for example methoxy, ethoxy, propoxy, isopropoxy, butoxy or tert-butoxy. It is possible to use as aryl for example phenyl or benzyl. Benzyl is preferably used. It is possible to use as aryloxy for example benzyloxy or phenoxy. Accordingly, the following examples are suitable as cyclopentene derivative of the general formula VII:

1-acetylamino-4-hydroxymethyl-2-cyclopentene, 1-butyrylamino-4-hydroxymethyl-2-cyclopentene or 1-phenylacetylamino-4-hydroxymethyl-2-cyclopentene.

It is expedient to select from the culture obtained by cultivation those which utilize the (1R,4S) isomer of the cyclopentene derivative of the formula VII as sole nitrogen source, as sole carbon source or as sole carbon and nitrogen source.

The microorganisms can use as suitable nitrogen

source, for example, ammonium, nitrates, amino acids or ureas as substrate for growth. The microorganisms can use as suitable carbon source, for example, sugars, sugar alcohols, C<sub>2</sub>-C<sub>4</sub>-carboxylic acids or amino acids as substrate for growth. Hexoses such as glucose or pentoses can be used as sugars. Glycerol, for example, can be used as sugar alcohol. Acetic acid or propionic acid can be used, for example, as C<sub>2</sub>-C<sub>4</sub>-carboxylic acids. Leucine, alanine, asparagine can be used, for example, as amino acids.

The selection medium and culture medium which can be used are those conventional among those skilled in the art, such as, for example, the one described in Table 1 or a complete medium (medium containing yeast extract), preferably using the one described in Table 1.

During the culturing and selection, the active enzymes of the microorganisms are expediently induced. The cyclopentene derivatives of the general formula VII can be used as enzyme inducer.

The culturing and selection normally takes place at a temperature from 20°C to 40°C, preferably from 30°C to 38°C and at a pH between 5.5 and 8.0, preferably between 6.8 and 7.8.

Preferred microorganisms are those of the genus *Rhodococcus*, *Gordona*, *Arthrobacter*, *Alcaligenes*, *Agrobacterium/Rhizobium*, *Bacillus*, *Pseudomonas* or *Alcaligenes/Bordetella*, in particular of the species *Rhodococcus erythropolis* CB 101 (DSM 10686), *Alcaligenes/Bordetella* FB 188 (DSM 11172), *Arthrobacter* sp. HSZ 5 (DSM 10328), *Rhodococcus* sp. FB 387 (DSM 11291), *Alcaligenes xylosoxydans* ssp. *denitrificans* HSZ 17 (DSM 10329), *Agrobacterium/Rhizobium* HSZ 30, *Bacillus simplex* K2, *Pseudomonas putida* K32, or *Gordona* sp. CB 100 (DSM 10687) and their functionally equivalent variants and mutants. Deposition in accordance with the Budapest Treaty at the Deutsche Sammlung von Mikroorganismen und Zellkulturen GmbH (DSMZ), Mascheroderweg 1b, D-38124 Braunschweig, took place on 20.05.1996 for the microorganisms DSM 10686 and 10687, on 6.11.1995 for

the microorganisms DSM 10328 and DSM 10329, on 8.10.1996 for the microorganism DSM 11291 and on 20.09.1996 for the microorganism DSM 11172.

"Functionally equivalent variants and mutants" mean microorganisms having essentially the same properties and functions as the original microorganisms. Variants and mutants of this type can be produced by chance, for example by UV radiation.

10 Taxonomic description of *Alcaligenes/Bordetella* FB 188 (DSM 11172)

	Cell form	rods

09922982-11401  
FOI TT-2852550

**Taxonomic description of *Rhodococcus erythropolis* CB 101 (DSM 106 86)**

1. Morphology and color of the colonies: short branched hyphae which, when old, disintegrate into rods and cocci, colonies glistening and partly confluent, beige with pink tinge, RAL 1001;
2. Diagnosed amino acid of the peptidoglycan: meso-diaminopimelic acid;
3. Mycolic acids: *Rhodococcus* mycolic acids; determination of the mycolic acid chain length ( $C_{32}$  -  $C_{44}$ ) and comparison of the data with the entries in the DSM mycolic acid data bank revealed very great similarity with the patterns of the *Rhodococcus erythropolis* strains (similarity 0.588).
4. Fatty acid pattern: unbranched, saturated and unsaturated fatty acids plus tuberculostearic acid.
5. On partial sequencing of the 16S rDNA of the strain, a high level of agreement (100%) was found with the sequences of the specific regions of *Rhodococcus erythropolis*.

The identification result is unambiguous because three mutually independent methods (mycolic acids, fatty acids, 16S rDNA) have assigned the strain to the species *Rhodococcus erythropolis*.

**Taxonomic description of *Gordona* sp. CB 100 (DSM 10687)**

1. Morphology and color of the colonies: short branched hyphae which, when old, disintegrate into rods and cocci, colonies pale orange, (RAL 2008);
2. Diagnosed amino acid of the peptidoglycan: meso-diaminopimelic acid;
3. Menaquinone pattern: MK-9 ( $H_2$ ) 100%;
4. Mycolic acids: *Gordona* mycolic acids; the mycolic acid chain length ( $C_{50}$  -  $C_{60}$ ) was determined by high temperature gas chromatography. This pattern corresponds to the pattern found in representatives of the genus *Gordona*.
5. Fatty acid pattern: unbranched, saturated and unsatu-

rated fatty acids plus tuberculostearic acid.

6. On partial sequencing of the 16S rDNA of the strain, only a relatively low agreement of 98.8% could be found with the sequences of the specific regions of *Gordona rubropertincta*.

On the basis of the available results (menaquinones, mycolic acids, fatty acids, 16S rDNA), although the isolate can be unambiguously assigned to the genus *Gordona* it is not possible on the basis of the results to make an assignment to a known *Gordona* species. It is therefore to be assumed that the strain DSM 10687 is a new and previously undescribed species of the genus *Gordona*.

# Taxonomic description of *Alcaligenes xylosoxydans* ssp. *denitrificans* HSZ 17 (DSM 10329)

## Properties of the strain

	Cell form	rods

	Hippurate	+

The profile of cellular fatty acids is typical of *Pseudomonas putida*.

- 30 Partial sequencing of the 16S rDNA revealed similarities of about 98% with *Pseudomonas mendocina* and *Pseudomonas alcaligenes*. The similarity with *Pseudomonas putida* was 97.4%.

35 Taxonomic description of *Rhodococcus* sp. FB 387 (DSM 11291)

1. Morphology and colour of the colonies: short branched hyphae which, when old, disintegrate to rods and

cocci, colonies matt, pale red-orange RAL 2008;

2. Diagnosed amino acid of the peptidoglycan: meso-diaminopimelic acid;

3. Mycolic acids: Rhodococcus mycolic acids;

5 Determination of the mycolic acid chain length ( $C_{32}$ - $C_{44}$ ) and comparison of the data with the entries in the DSMZ mycolic acid data bank revealed only very small similarity with the patterns of Rhodococcus ruber strains (similarity 0.019). This correlation factor is  
10 too low to be used for species identification.

4. Fatty acid pattern: unbranched, saturated and unsaturated fatty acids plus tuberculostearic acid.

This fatty acid pattern is diagnostic for all representatives of the genus Rhodococcus and its close  
15 relatives such as Mycobacterium, Nocardia and Gordona. An attempt was made by including the qualitative and quantitative differences in the fatty acid pattern to carry out a differentiation to the species level. Numerical methods were used to compare the fatty acid  
20 pattern of Rhodococcus sp. FB 387 with the entries in the data bank. It was not possible with this method either to assign Rhodococcus sp. FB 387, because of the small similarity (0.063), to any described Rhodococcus species.

25 5. On partial sequencing of the 16S rDNA of the strain, 96-818 was assigned to Rhodococcus opacus with a correlation of 97.9%. This sequence agreement is far below that of 99.5% required for unambiguous species assignment in this taxon.

30 On the basis of the available results, it can be assumed that the strain Rhodococcus sp. FB 387 is a new and not previously described Rhodococcus species.

The enzymes of the invention, the N-acetylalcohol  
35 pentene derivatives of the above formula VII, can be obtained, for example, by disruption of the microorganism cells of the invention in a way conventional for the skilled person. It is possible to use for this for

example the ultrasound or French press method. These enzymes can be obtained for example from *Rhodococcus erythropolis* CB 101 (DSM 10686) microorganisms. Enzymes obtainable from the microorganisms of the invention, especially *Rhodococcus erythropolis* CB 101 (DSM 10686), preferably have the following properties:

- a) a pH optimum of  $\text{pH } 7.0 \pm 1.0$ ;
- b) a temperature optimum between  $25^{\circ}$  and  $30^{\circ}\text{C}$  at a pH of 7.0; and
- c) a  $K_m$  for the substrate 1-acetylamino-hydroxymethyl-2-cyclopentene of  $22.5 \text{ mM} \pm 7.5 \text{ mM}$  ( $30^{\circ}\text{C}$ , 100 mM phosphate buffer, pH 7.0).

Sequence analysis of an enzyme obtainable from *Rhodococcus erythropolis* CB 101 (DSM 10686) further revealed:

- d) an N-terminal amino acid sequence of Thr-Glu-Gln-Asn-Leu-His-Trp-Leu-Ser-Ala-Thr-Glu-Met-Ala-Ala-Ser-Val-Ala-Ser-Asn;

and a molecular weight determination revealed:

- e) a molecular weight of 50 kD determined by SDS-PAGE.

Enzymes like those obtainable from the microorganisms of the invention, for example *Rhodococcus erythropolis* CB 101 (DSM 10686), hydrolyse, for example, in particular 1-acetylamino-4-hydroxymethyl-2-cyclopentene, 1-butyrylamino-4-hydroxymethyl-2-cyclopentene, 1-propionylamino-4-hydroxymethyl-2-cyclopentene and 1-isobutyrylamino-4-hydroxymethyl-2-cyclopentene.

The process of the invention for the preparation of (1R,4S) - or (1S,4R) - 1-amino-4-(hydroxymethyl)-2-cyclopentene of the formulae

I

II

and/or of (1S,4R)- or (1R,4S)-amino alcohol derivatives  
of the general formulae

III

IV

in which R<sup>1</sup> has the stated meaning, can be carried out  
for example by, in a first stage, acylating (±)-2-aza-  
5 bicyclo[2.2.1]hept-5-en-3-one of the formula

V

to give a (±)-2-azabicyclo[2.2.1]hept-5-en-3-one deriva-  
tive of the general formula

VI

in which R<sup>1</sup> has the stated meaning.

The precursor (±)-2-azabicyclo[2.2.1]hept-5-en-  
10 3-one can be prepared as disclosed in EP-B 0 508 352.

The acylation can be carried out with a carbonyl  
halide of the general formula

VIII ,

in which X denotes a halogen atom, and R<sup>1</sup> has the stated  
meaning, or with a carboxylic anhydride of the general  
15 formula

IX ,

0999988-14401  
FOI 2852660

in which R<sup>1</sup> has the stated meaning.

F, Cl, Br or I can be used as halogen atom X. Cl or F is preferably used.

Examples of carbonyl halides are: acetyl chloride, chloroacetyl chloride, butyryl chloride, isobutyryl chloride, phenylacetyl chloride, benzyl chloroformate (Cbz-Cl), propionyl chloride, benzoyl chloride, allyl chloroformate or tert-butyl fluoroformate. Examples of carboxylic anhydrides are: di-tert-butyl dicarbonate, butyric anhydride, acetic anhydride or propionic anhydride.

The acylation can be carried out without solvent or with an aprotic solvent.

The acylation is expediently carried out in an aprotic solvent. Examples of suitable aprotic solvents are pyridine, acetonitrile, dimethylformamide, tetrahydrofuran, toluene, methylene chloride, N-methylpyrrolidone or mixtures thereof. The solvent preferably used is pyridine or acetonitrile, in particular a mixture of pyridine and acetonitrile.

The acylation is expediently carried out at a temperature from -80 to 50°C, preferably from 0 to 25°C.

In a second stage of the process, the (±)-2-azabicyclo[2.2.1]hept-5-en-3-one derivative of the formula VI can be reduced to give a cyclopentene derivative of the general formula

VII

in which R<sup>1</sup> has the stated meaning.

The reduction is expediently carried out with an alkali metal borohydride or alkaline earth metal borohydride, with an alkali metal aluminium hydride or alkaline earth metal aluminium hydride or with Vitride (sodium bis(2-methoxyethoxy)aluminium hydride). Sodium or potassium aluminium hydride can be used as alkali metal aluminium hydride. Sodium or potassium borohydride can be used as alkali metal borohydride. Calcium borohydride can

be used as alkaline earth metal borohydride.

The reduction is expediently carried out in a protic solvent. Protic solvents which can be used are lower aliphatic alcohols such as methanol, ethanol, 5 propanol, isopropanol, butanol, isobutanol, sec-butanol, tert-butanol, or water, or mixtures thereof.

The reduction is expediently carried out at a temperature from -40 to 40°C, preferably from 0 to 20°C.

The conversion of the cyclopentene derivative of the general formula VII into the (1R,4S)- or (1S,4R)-1-amino-4-(hydroxymethyl)-2-cyclopentene of the formulae 10

I

II

is carried out according to the invention either by means of microorganisms or enzyme extracts therefrom, by means of penicillin G acylases or by means of enzymes having N-acetyl-amino-alcohol 15 hydrolase activity. This biotransformation results not only in the (1R,4S)- or (1S,4R)-1-amino-4-(hydroxymethyl)-2-cyclopentene of formula I or II, which is isolated where appropriate, but also in the (1S,4R)- or (1R,4S)-amino alcohol derivative 20 of the general formulae

III

IV

in which R<sup>1</sup> has the stated meaning. The latter can likewise be isolated where appropriate.

All microorganisms which utilize a cyclopentene derivative of the general formula VII as sole nitrogen source, as sole carbon source or as sole carbon and 25 nitrogen source are suitable. The biotransformation is expediently carried out with microorganisms which utilize the (1R,4S) isomer of the cyclopentene derivative as sole carbon source, as sole carbon and nitrogen source or as 30 sole nitrogen source.

The biotransformation is preferably carried out

by means of microorganisms of the genus *Alcaligenes*/  
*Bordetella*, *Rhodococcus*, *Arthrobacter*, *Alcaligenes*,  
*Agrobacterium/Rhizobium*, *Bacillus*, *Pseudomonas* or  
*Gordona*, in particular of the species *Algaligenes*/  
5 *Bordetella* FB 188 (DSM 11172), *Rhodococcus erythropolis*  
CB 101 (DSM 10686), *Arthrobacter* sp. HSZ 5 (DSM 10328),  
*Rhodococcus* sp FP 387 (DSM 11291), *Alcaligenes xylos-*  
*oxydans* ssp. *denitrificans* HSZ 17 (DSM 10329), *Agro-*  
*bacterium/Rhizobium* HSZ 30, *Bacillus simplex* K2,  
10 *Pseudomonas putida* K32, or *Gordona* sp. (DSM 19687), and  
with the functional equivalent variants and mutants  
thereof. These microorganisms are, as already described,  
deposited in accordance with the Budapest Treaty.

The microorganism species very particularly  
15 suitable for the process are *Alcaligenes/Bordetella* FB  
188 (DSM 11172), *Rhodococcus erythropolis* CB 101 (DSM  
10686) and *Gordona* sp. CB 100 (DSM 10687).

The biotransformation can be carried out, after  
conventional initial cultivation of these microorganisms,  
20 with quiescent cells (non-growing cells no longer  
requiring a carbon and energy source) or with growing  
cells. The biotransformation is preferably carried out  
with quiescent cells.

The enzymes according to the invention which are  
25 suitable for the process, the N-acetylamino-alcohol  
hydrolases, can be obtained by the methods described  
above and have the properties already described above.

Suitable penicillin G acylases are obtained from  
many microorganisms such as, for example, bacteria or  
30 actinomycetes, specifically from the following micro-  
organisms: *Escherichia coli* ATCC 9637, *Bacillus mega-*  
*terium*, *Streptomyces lavendulae* ATCC 13664, *Nocardia* sp.  
ATCC 13635, *Providencia rettgeri* ATCC 9918, *Arthrobacter*  
*viscosus* ATCC 15294, *Rhodococcus fascians* ATCC 12975,  
35 *Streptomyces phaeochromogenes* ATCC 21289, *Achromobacter*  
ATCC 23584 and *Micrococcus roseus* ATCC 416. Penicillin G  
acylases which can be bought are used in particular, such  
as penicillin G acylase EC 3.5.1.11 from *E.coli* (Boeh-  
ringer Mannheim) or from *Bacillus megaterium*.

09992988-11401

Immobilized penicillin G acylases are used in a preferred embodiment.

The biotransformation can be carried out in media usual in the art, such as, for example, in low-molarity phosphate, citrate or Hepes buffer, in water, in complete media such as, for example, Nutrient Yeast Broth (NYB) or in that described in the table. The biotransformation is preferably carried out in the medium shown in Table 1 or in low-molarity phosphate buffer.

The biotransformation is expediently carried out with a single or continuous addition of the cyclopentene derivative (formula VII) so that the concentration does not exceed 10% by weight, preferably 2% by weight.

The pH during the biotransformation can be in a range from 5 to 9, preferably from 6 to 8. The biotransformation is expediently carried out at a temperature from 20 to 40°C, preferably from 25 to 30°C.

If the (1S,4R)-1-amino-4-(hydroxymethyl)-2-cyclopentene is formed during the biotransformation, this can be converted into the (1R,4S)-1-amino-4-(hydroxymethyl)-2-cyclopentene by acid hydrolysis, for example with hydrochloric acid.

#### Examples:

##### Example 1

Preparation of (+)-2-acetyl-2-azabicyclo[2.2.1]hept-5-en-3-one

100 g of (+)-2-azabicyclo[2.2.1]hept-5-en-3-one were dissolved in acetonitrile (800 ml) and pyridine (161.26 ml) under nitrogen. At 12°C, 104.5 g of acetyl chloride were added dropwise over the course of 2 hours. The mixture was then stirred at room temperature for 4.5 hours. 800 ml of water were added to the mixture, and the acetonitrile was evaporated off in vacuo. The aqueous phase was extracted 3 times with 400 ml of ethyl acetate.

The combined org. phases were washed with 1N HCl (400 ml), water (400 ml), saturated NaCl (400 ml), dried with magnesium sulphate and completely evaporated. The

**Example 3****Preparation of (+)-2-phenylacetyl-2-azabicyclo[2.2.1]-hept-5-en-3-one**

33.4 g of (+)-2-azabicyclo[2.2.1]hept-5-en-3-one  
5 were dissolved in acetonitrile (240 ml) and pyridine  
(48.3 ml) under nitrogen. At 12°C, 68.6 g of phenylacetyl  
chloride were added dropwise over the course of 30  
minutes. The mixture was then stirred at room temperature  
for 3.5 hours. 240 ml of water were added to the mixture.  
10 The acetonitrile was evaporated off in vacuo, and the  
aqueous phase was extracted 3 times with ethyl acetate  
(150 ml). The combined org. phases were washed with 1N  
HCl (150 ml), saturated NaCl (150 ml) and water (150 ml),  
dried with magnesium sulphate and completely evaporated.  
15 The crude product was filtered through silica gel  
(hexane:ethyl acetate = 1:1). 68.34 g of the crude  
product were obtained as a yellow oil.

**Example 4****Preparation of (+)-2-propionyl-2-azabicyclo[2.2.1]hept-5-en-3-one**

47 g of (+)-2-azabicyclo[2.2.1]hept-5-en-3-one  
were dissolved in acetonitrile (325 ml) and pyridine  
(41 ml) under nitrogen. At 12°C, 43.9 g of propionyl  
chloride were added dropwise over the course of 1 h. The  
25 reaction was then stirred at room temperature for 5 h.  
145 ml of water were added to the mixture, and the aceto-  
nitrile was evaporated off in vacuo. The aqueous phase  
was extracted 3 times with 115 ml of ethyl acetate. The  
combined organic phases were washed with 1N HCl (140 ml),  
30 saturated NaHCO<sub>3</sub> (40 ml) and NaCl (40 ml) solutions,  
dried with sodium sulphate and completely evaporated. The  
residue was purified by distillation. 55.8 g of title  
compound were obtained and solidified on leaving to  
stand. The yield was 81.6%.

#### Example 5

#### Preparation of (+)-2-isobutyryl-2-azabicyclo[2.2.1]hept-5-en-3-one

45.1 g of (+)-2-azabicyclo[2.2.1]hept-5-en-3-one were dissolved in acetonitrile (310 ml) and pyridine (39 ml) under nitrogen. At 10°C, 54.1 g of isobutyryl chloride were added dropwise over the course of 1 h. The reaction was then stirred at room temperature for 5 h. 140 ml of water were added to the mixture, and the acetonitrile was evaporated off in vacuo. The aqueous phase was extracted with 4x 120 ml of ethyl acetate. The combined organic phases were washed with 1N HCl (50 ml), saturated NaHCO<sub>3</sub> (50 ml) and NaCl (50 ml) solutions, dried with sodium sulphate and completely evaporated. The residue was boiled under reflux in n-hexane (240 ml) with active charcoal. After filtration of the active charcoal, the filtrate was cooled to 0°C and the title compound was filtered. 54.5 g of product were obtained. The yield was 76%.

Melting point: 41 - 42°C

#### Example 6

#### Preparation of (+)-2-chloroacetyl-2-azabicyclo[2.2.1]hept-5-en-3-one

10.1 g of (+)-2-azabicyclo[2.2.1]hept-5-en-3-one

5 were dissolved in a mixture of dichloromethane (10 ml),  
pyridine (8.4 ml) and 0.22 g of 4-N,N-dimethylamino-  
pyridine at 10°C under nitrogen. 13.5 g of chloroacetyl  
chloride were added dropwise over the course of 1 h. The  
10 temperature rose to 44°C. The mixture was stirred for a  
further 2 h at room temperature. 100 ml of water were  
added to the solution. After phase separation, the  
aqueous phase was extracted with 100 ml of dichloro-  
methane. The combined organic phases were dried with  
10 sodium sulphate and completely evaporated. The residue  
was boiled in 100 ml of diisopropyl ether under reflux in  
the presence of 1 g of active charcoal for 10 minutes.  
After hot filtration, the filtrate was cooled to room  
temperature, and the solid was filtered and dried.  
15 10.35 g of title compound were obtained. The yield was  
60%.

Melting point: 86 - 88°C

#### 25 Example 7

Preparation of (±)-1-acetylamino-4-hydroxymethyl-2-cyclo-  
pentene

79.56 g of (±)-2-acetyl-2-azabicyclo[2.2.1]hept-  
5-en-3-one were dissolved in ethanol (450 ml) under  
30 nitrogen and cooled to -10°C. 19.8 g of sodium boro-  
hydride were added in portions over the course of  
45 minutes.

The reaction was stirred at 0°C for 3 hours and  
then the pH was adjusted to 1.8 with conc. sulphuric  
35 acid. Ethyl acetate (200 ml) was added to this mixture,  
and the solids were filtered off. It was then completely  
evaporated. The residue was taken up in water, washed  
with methylene chloride and completely evaporated. The

crude product was purified by a silica gel filtration using ethyl acetate/methanol 5:1 as solvent. The filtrate was concentrated. 51.83 g of product were obtained as a white solid. The yield was 64% based on 2-acetyl-2-azabicyclo[2.2.1]hept-5-en-3-one employed.

**Example 10****35 Preparation of (±)-1-BOC-amino-4-hydroxymethyl-2-cyclopentene**

15 g of crude (±)-1-amino-4-hydroxymethyl-2-

cyclopentene hydrochloride were dissolved in a mixture of 150 ml of water and 150 ml of dioxane at room temperature under nitrogen. The solution was adjusted to pH 14 with 1N NaOH, then a diethyl ether solution of tert-butyloxy-carbonyl fluoride (BOC-F, 20% excess) was added, and the mixture was stirred for a further 3 h at room temperature (BOC-F prepared as disclosed in Synthesis 1975, 599). The pH was adjusted to 2 with conc. HCl. After distillation of the organic solvents, 50 ml of water were added to the residue, and the mixture was extracted with 3x 100 ml of ethyl acetate. The combined organic phases were completely evaporated. The residue was crystallized in a mixture of 110 ml of diisopropyl ether and 80 ml of n-hexane. 11.95 g of title compound were obtained. The yield was 56%.

Melting point: 68 - 70°C

### 10 Example 13

Preparation of (1R,4S)-1-amino-4-(hydroxymethyl)-2-cyclopentene using penicillin G acylases

Penicillin G acylase EC 3.5.1.11 from E.coli (Boehringer Mannheim) 165 U (units)/g or penicillin G acylase EC 3.5.1.11 from Bacillus megaterium was employed for the biotransformation.

For this, 50 mM sodium phosphate buffer (pH 5 - 9; 4 ml) was incubated with 1% by weight of non-racemic 1-phenylacetyl-amino-4-hydroxymethyl-2-cyclopentene and 400 mg of the appropriate penicillin G acylase at 37°C.

Samples were taken after defined time intervals and were analyzed by thin-layer chromatography (silica gel 60, butanol:water:glacial acetic acid = 3:1:1; detection with ninhydrin), gas chromatography (capillary column, HP-5, 5% phenylmethyldisiloxane) or HPLC. The enzyme eliminated the phenylacetyl group with high activity and thereby liberated up to 40% of the corresponding amino alcohol. The free amino alcohol was obtained with a ee of 80%.

### 30 Example 14

Preparation of (1R,4S)-1-amino-4-(hydroxymethyl)-2-cyclopentene using microorganisms

14.1 Sewage sludge (20%) from the ARA water treatment plant in Visp was incubated in the A + N medium (see Table 1) containing 0.5% by weight of 1-acetyl-, 1-propionyl-, 1-isobutyryl- or 1-butyrylamino-4-hydroxymethyl-2-cyclopentene at 37°C with shaking. The

formation of (1R,4S)-1-amino-4-(hydroxymethyl)-2-cyclopentene was followed by thin-layer chromatography.

1-3 transfers were carried out with 1% of these enrichments, and isolation took place on solid media (plate count agar in the medium of Table 1; 20 g/l). The microorganisms *Alcaligenes/Bordetella* FB 188 (DSM 1172), *Rhodococcus erythropolis* CB 101 (DSM 10686), *Gordona* sp. CB 100 (DSM 10687) and *Rhodococcus* sp. FB 387 (DSM 11291) were isolated in this way.

14.2 The microorganisms isolated in this way were cultivated in the medium (Table 1) containing 0.5% of 1-acetyl-, 1-propionyl-, 1-isobutyryl- or 1-butyryl-amino-4-hydroxymethyl-2-cyclopentene. They grew to an optical density (OD) of 2 to 3 in 24 to 36 hours. The cells obtained in this way were harvested in the late exponential phase of growth and were washed in 10 mM phosphate buffer.

The subsequent biotransformation was carried out in 50 mM phosphate buffer (pH 4.5-9) containing 1% by weight of 1-acetyl-, 1-isobutyryl- or 1-butyryl-amino-4-hydroxymethyl-2-cyclopentene. It was found by thin-layer chromatography that 50% of the substrate were hydrolyzed to (1R,4S)-1-amino-4-(hydroxymethyl)-2-cyclopentene. HPLC analyses revealed ee values between 80 and 93%.

When 1-butyrylamino-4-hydroxymethyl-2-cyclopentene was employed as substrate, the biotransformation rate was 0.14 (g/l/h/OD) for the strain DSM 10686 when cultivation took place on a A + N medium and 0.03 (g/l/h/OD) when cultivation took place on NYB (nutrient yeast broth) medium containing 1-butyryl-amino-4-hydroxymethyl-2-cyclopentene.

When the same conversion was carried out with the strain DSM 10687 at a substrate concentration (1-

0992982-11401  
T04F1 286660

butyrylamino-4-hydroxymethyl-2-cyclopentene) of  
200 mM, the biotransformation rate was 0.161  
(g/l/h/OD).

Table 1 A + N medium

5	MgCl <sub>2</sub>	0.4 g/l
	CaCl <sub>2</sub>	0.014 g/l

	Trace element solution	1 ml/l
	pH 7.5	

- 15 14.3 *Rhodococcus erythropolis* DSM 10686 was cultured in  
minimal medium (cf. Table 2) with ammonium acetate  
(3 g/l) as carbon and nitrogen source in a 6 l  
fermenter at 30°C to a cell density of OD 650 > 25.  
During cell growth, 50% acetic acid was added con-  
tinuously as additional C source. In order to induce  
the enzymatic activity, 60 g of (+/-)-1-acetylamino-  
4-hydroxymethyl-2-cyclopentene were then added, and  
incubation was continued for some hours. Finally, a  
further 40 g of (+/-)-1-acetylamino-4-hydroxymethyl-  
2-cyclopentene were added, and incubation was then  
carried out for a further 10 hours. The progress of  
the biotransformation was followed on-line by HPLC.  
When an analytical yield of 40%, based on the  
racemic substrate employed, and a ee of 85% were  
reached, fermentation was stopped by adding acid.

14.4 In analogy to Example 14.3, the microorganisms  
 Arthrobacter sp. HSZ 5 (DSM 10328, Rhodococcus sp.  
 FB387 (DSM 11291), Alcaligenes xylosoxydans ssp.  
 20 denitrificans HSZ 17 (DSM 10329), Agrobacterium/  
 Rhizobium HSZ 30, Bacillus simplex K2 and  
 Pseudomonas putida K32 were cultured on sodium  
 acetate in the medium (Table 1) with and without 1-  
 acetyl-, 1-propionyl-, 1-isobutyryl- or 1-butyryl-  
 25 amino-4-hydroxymethyl-2-cyclopentene, abbreviated to  
 amino alcohols hereinafter.

The following results were obtained with exponential  
 cells cultured without amino alcohols (HPLC analy-  
 sis):

30	Strain	Rate [mmol/OD.h]	ee/conversion [%]
	HSZ 5 (DSM 10328)	0.05	88.7/16
	HSZ 17 (DSM 10329)	0.005	95/23
	K32	0.05	54/1
	CB101 (DSM 10686)	0.1	84/39

The strains K2 and K17 were cultured, harvested and subjected to a 60-hour biotransformation.

Strain	Rate [mmol/OD.h]	ee/conversion [%]
K2	-	92/10
HSZ 30	-	93/3.5

Exponential and stationary cells were harvested from all the batches and employed as quiescent cells for the biotransformation. There was no observable difference, from the TLC analysis, in the initial rate of cells induced with amino alcohol or not induced.

#### Example 15

Purification of the N-acetylamino-alcohol hydrolase from *Rhodococcus erythropolis* CB101 (DSM 10686)

The enzyme was purified as described below until there was only one protein band in the SDS-PAGE (Pharmacia Phast gel, 10-15% gradient) at a molecular weight of 50 kD.

Cells of *Rhodococcus erythropolis* CB101 (DSM 10686) were washed in 50 mM tris buffer (pH 6.2) and concentrated to an optical density  $OD_{650\text{ nm}}$  of 190. After addition of phenylmethanesulphonyl fluoride (PMSF) to a final concentration of 1 mM and DNase, the cells were treated with a French press in order to obtain a crude extract. Centrifugation resulted in 200 ml of a cell-free extract with a protein concentration of  $4.8\text{ mg ml}^{-1}$ .

960 mg of the cell-free extract were loaded onto a HiLoad 26/10 Q-Sepharose ion exchange chromatography column (Pharmacia) which had been equilibrated with a 50 mM tris buffer (pH 8.0) containing 1 mM dithiothreitol (DTT).

After the column had been washed with the same buffer, the proteins were eluted with a linear buffer gradient (1500 ml; gradient: 50 mM tris buffer (pH 8.0) containing 1 mM DTT - 50 mM tris buffer (pH 7.0) containing 1 mM DTT and 1 M NaCl). The enzyme eluted from the column between 370 and 430 mM NaCl and at a pH of 7.6.

The active fractions were collected and concentrated to 9 ml. The protein content was 41 mg.

For further purification, the protein solution was loaded onto a HiLoad 26/60 Superdex 75 gel filtration chromatography column (Pharmacia) which had been equilibrated with a 50 mM tris buffer containing 50 mM NaCl and 1 mM DTT. The active fractions were combined and had a total protein content of 10.9 mg.

This protein solution was loaded onto a Mono Q HR5/5 column (Pharmacia) which had been equilibrated with 50 mM tris buffer (pH 8.5) containing 1 mM DTT. The proteins were eluted with a linear gradient (40 ml) of 50 mM tris buffer (pH 8.5) containing 1 mM DTT - 50 mM tris buffer (pH 8.5) containing 1 mM DTT and 1 M NaCl. The enzyme eluted between 390 mM NaCl and 440 mM NaCl. The active fractions contained 1.4 mg of protein.

In the last purification step, the same column was used, equilibrated with the same buffer. The elution gradient used was the same buffer with 0 - 500 mM NaCl and pH 7.0 - 8.5. It was possible in this way to isolate 430 µg of pure enzyme.

The N-terminal sequence of the enzyme was determined directly from the protein blot. A sequence of the following 20 amino acids was obtained: Thr-Glu-Gln-Asn-Leu-His-Trp-Leu-Ser-Ala-Thr-Glu-Met-Ala-Ala-Ser-Val-Ala-Ser-Asn.

This sequence showed no homology with known proteins.

#### Example 16

#### Enzyme characterization

The enzyme characterization was carried out both with purified enzyme and with cell-free extract which had been desalted using a Sephadex G-25 column (PD-10, Pharmacia).

The protein concentration in the cell-free extract was 7.3 mg ml<sup>-1</sup> and the protein concentration of the purified enzyme was 135 µg ml<sup>-1</sup>. PMSF was not added to the cell-free extract.

16.1  $K_m$  determination

The  $K_m$  determination was carried out in a cell-free extract. The  $K_m$  for the reaction at pH 7.0 and at a temperature of 30°C was 22.5 mM for the substrate 1-acetylamino-4-hydroxymethyl-2-cyclopentene.

## 16.2 pH optimum

The pH optimum for the hydrolysis of 1-acetylamino-4-hydroxymethyl-2-cyclopentene (25 mM) was determined with the purified enzyme and in cell-free extract in a pH range of pH 6.2-9.0 in the following buffer solutions.

Tris buffer 100 mM pH 9.0; 8.5; 8.0; 7.5; 7.0

Citrate/phosphate buffer 100 mM pH 7.0; 6.55; 6.2

The activity was measured for 24 h.

The pH optimum for the reaction was between pH 7.0 and pH 7.5 for production of the 1R,4S and the 1S,4R enantiomer.

The pH optimum for the activity in the cell-free extract was at pH 7.0. The selectivity was, however, better between pH 6.0 and pH 7.0.

Figure 1 shows the activity of the N-acetylamino-alcohol hydrolase (cell-free extract) from *Rhodococcus erythropolis* CB 101 (DSM 10686) as a function of the pH.

## 16.3 The temperature optimum for the reaction indicated in Example 16.2 was between 25 and 30°C.

Figure 2 shows the activity of the N-acetylamino-alcohol hydrolase (cell-free extract) from *Rhodococcus erythropolis* CB 101 (DSM 10686) as a function of the temperature.
